

Ansible Automation Platform 2.1

Intro & Roadmap

Götz Rieger
Principal Solution Architect, Red Hat

Red Hat **Ansible Automation Platform** **2.1**

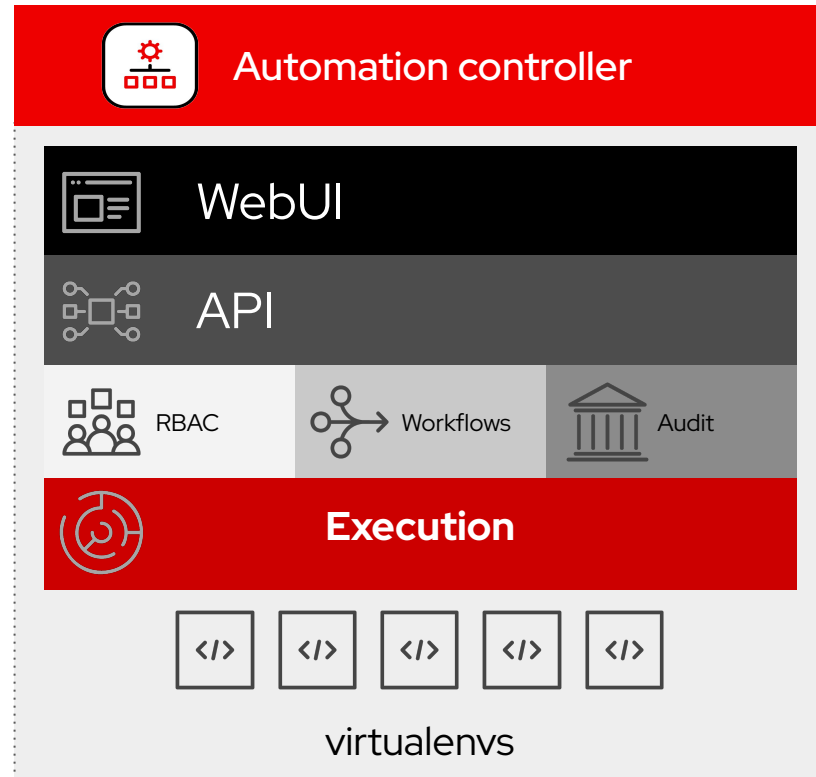

Ansible Tower and **Ansible Engine** are **no more**.

The product is called
Red Hat Ansible Automation Platform.

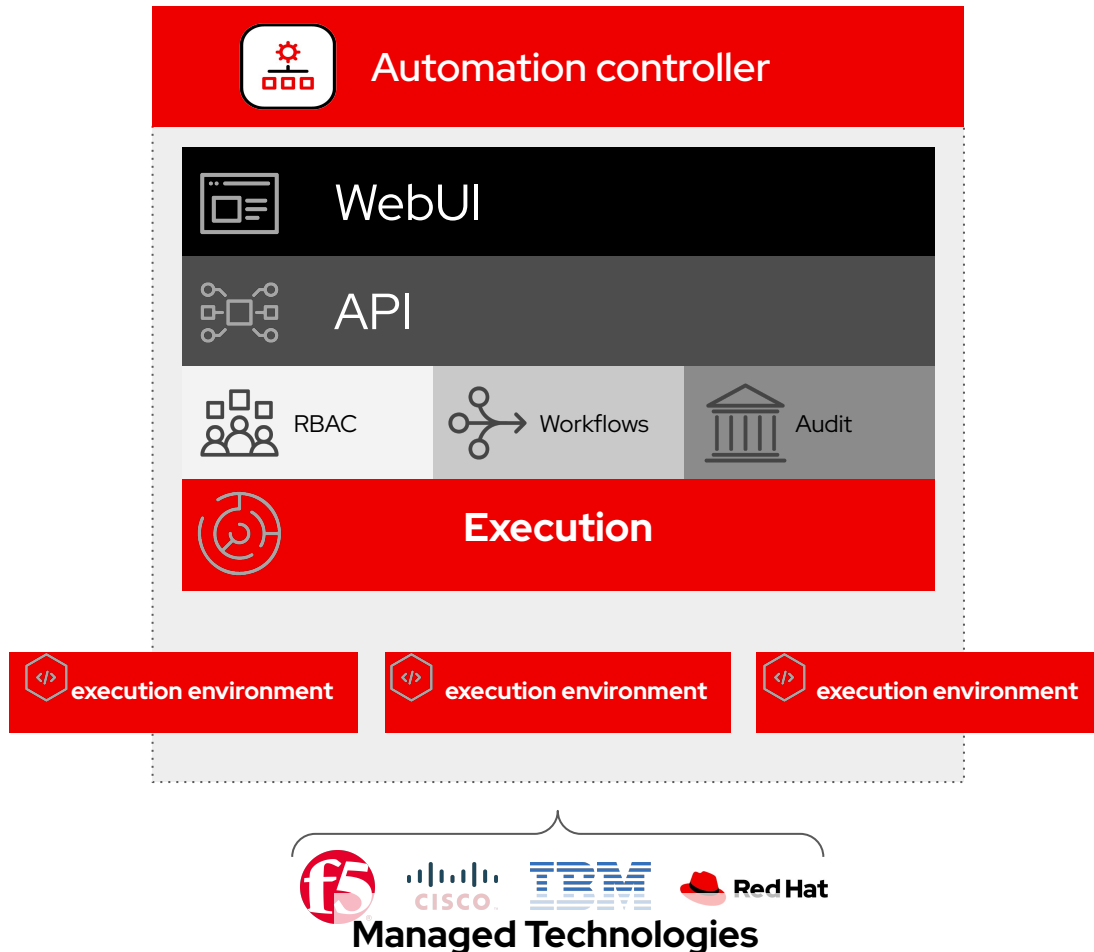

Automation for an **agile** world

Ansible Automation Platform 1 Architecture

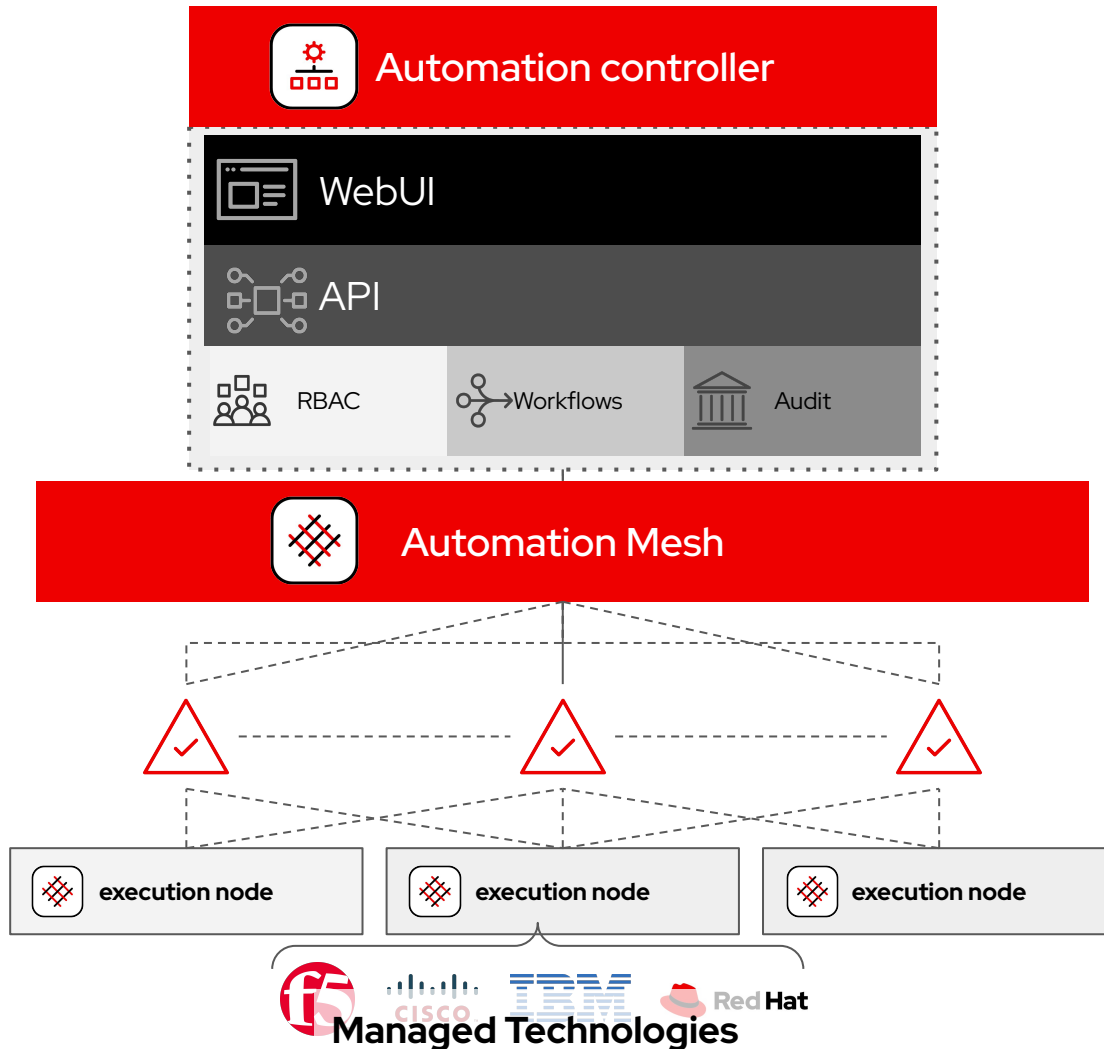

- ▶ The **artist** formerly known as **Ansible Tower**
- ▶ **Centralized, monolithic** application
- ▶ **Control** and **execution** cluster **capacity shared**
- ▶ Closely coupled to database, **requires low latency**

Ansible Automation Platform 2.0 Early Access (July 2021)

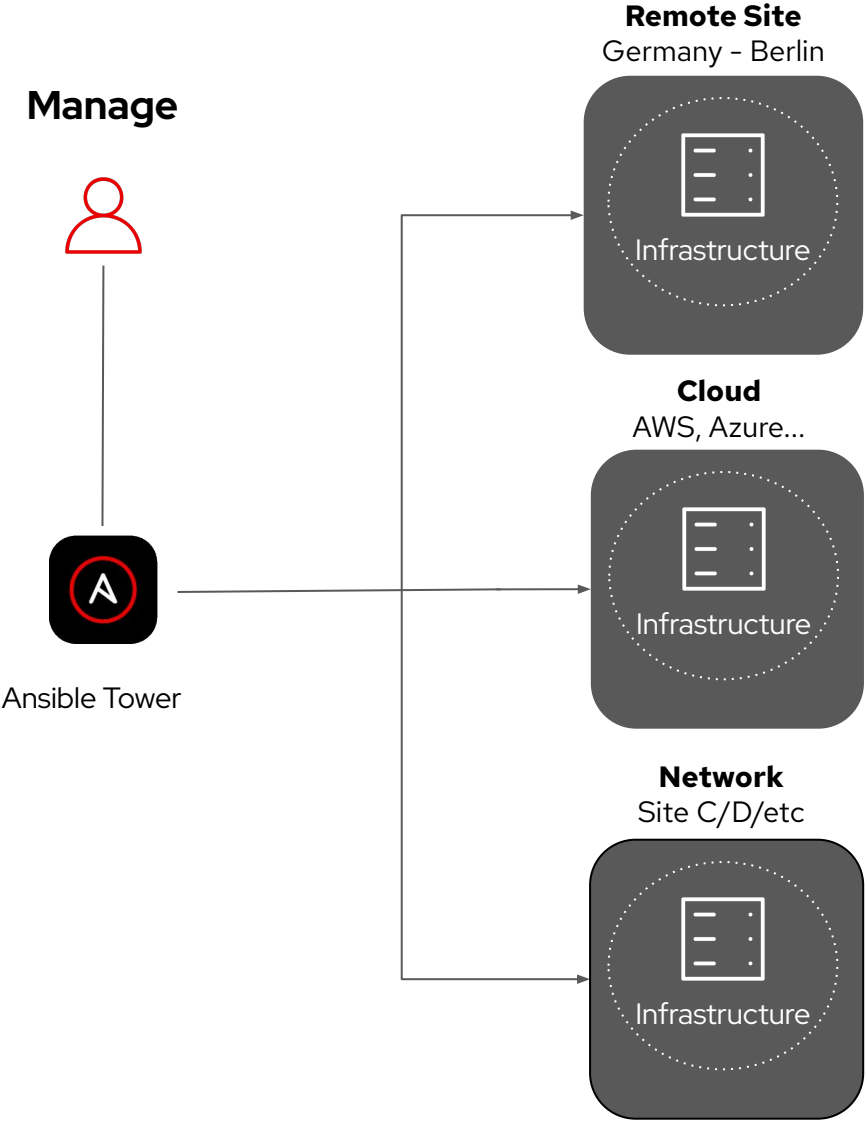

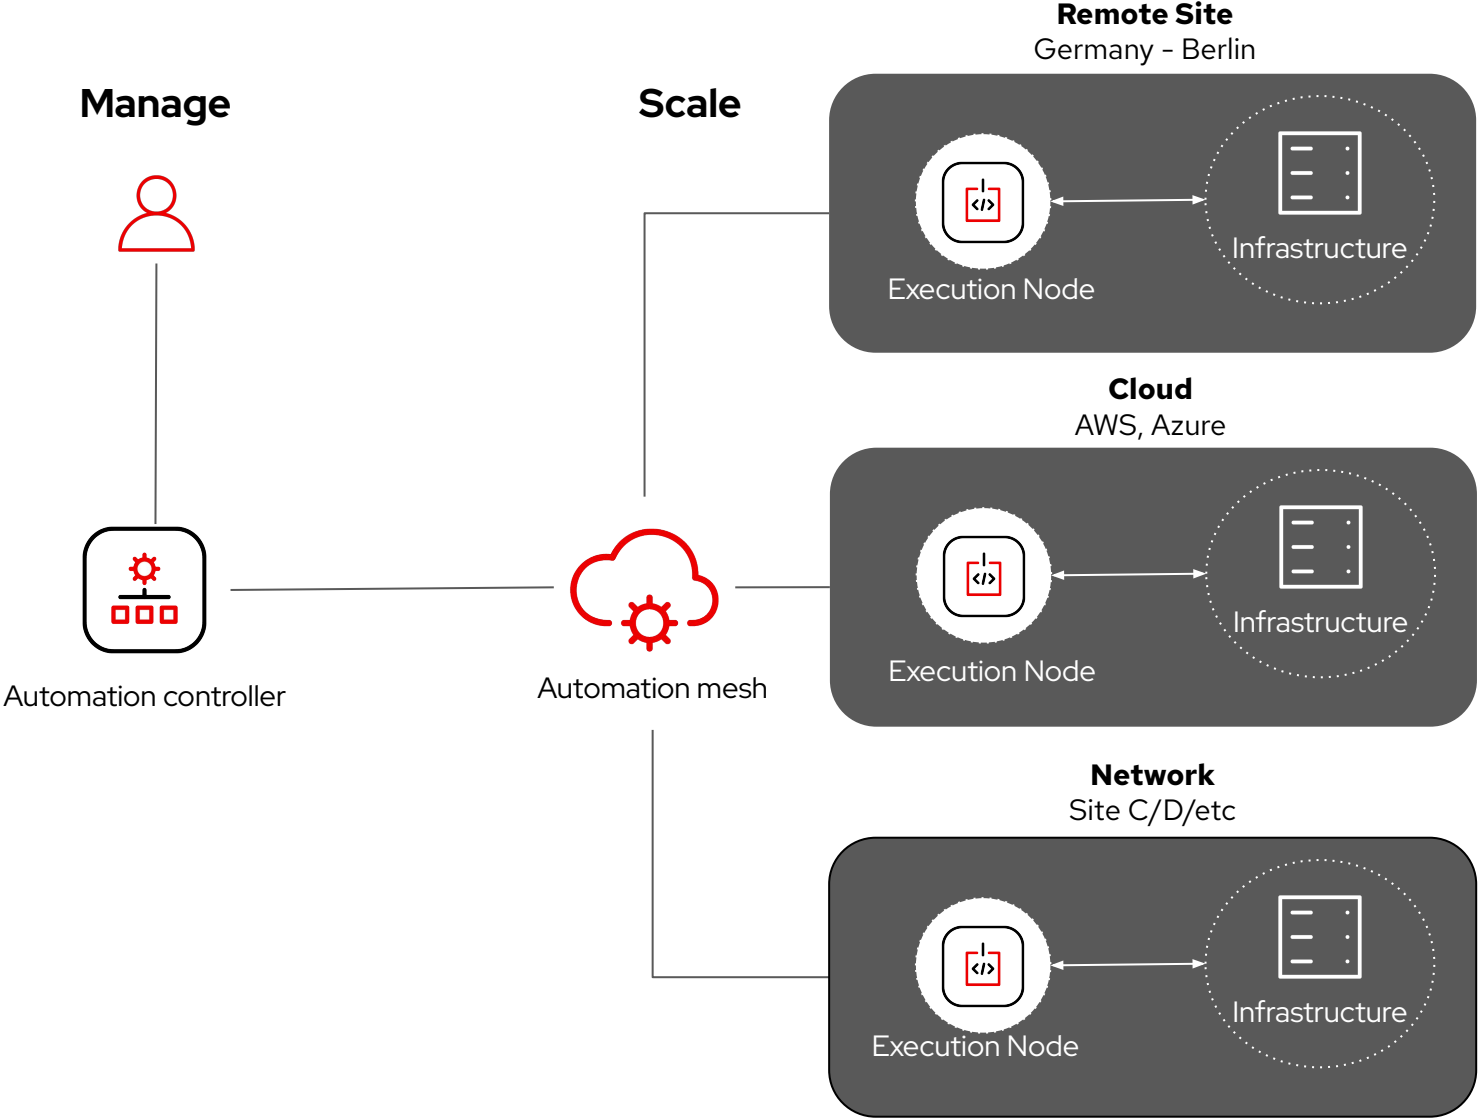

- ▶ **Started to modularize**
- ▶ **Control node still contains control plane and execution plane**
- ▶ **Containerized execution environments**

Ansible Automation Platform 2.1 – GA since December 2021

- ▶ **Dynamic cluster capacity**, Cluster capacity scales independently
- ▶ **Decoupled execution and control plane**, deploy execution capacity where it's needed
- ▶ Execution plane **resilient to latency/interruptions**
- ▶ Natively build **redundant mesh** topologies
- ▶ **Centralized management** with automation controller

Automation Mesh

What is automation mesh?

Simple, flexible and reliable scaling of execution capacity

Automate at a global scale

Simple, flexible and reliable way to scale automation.

Distributed overlay network

Overlay network which eases distributing automation execution

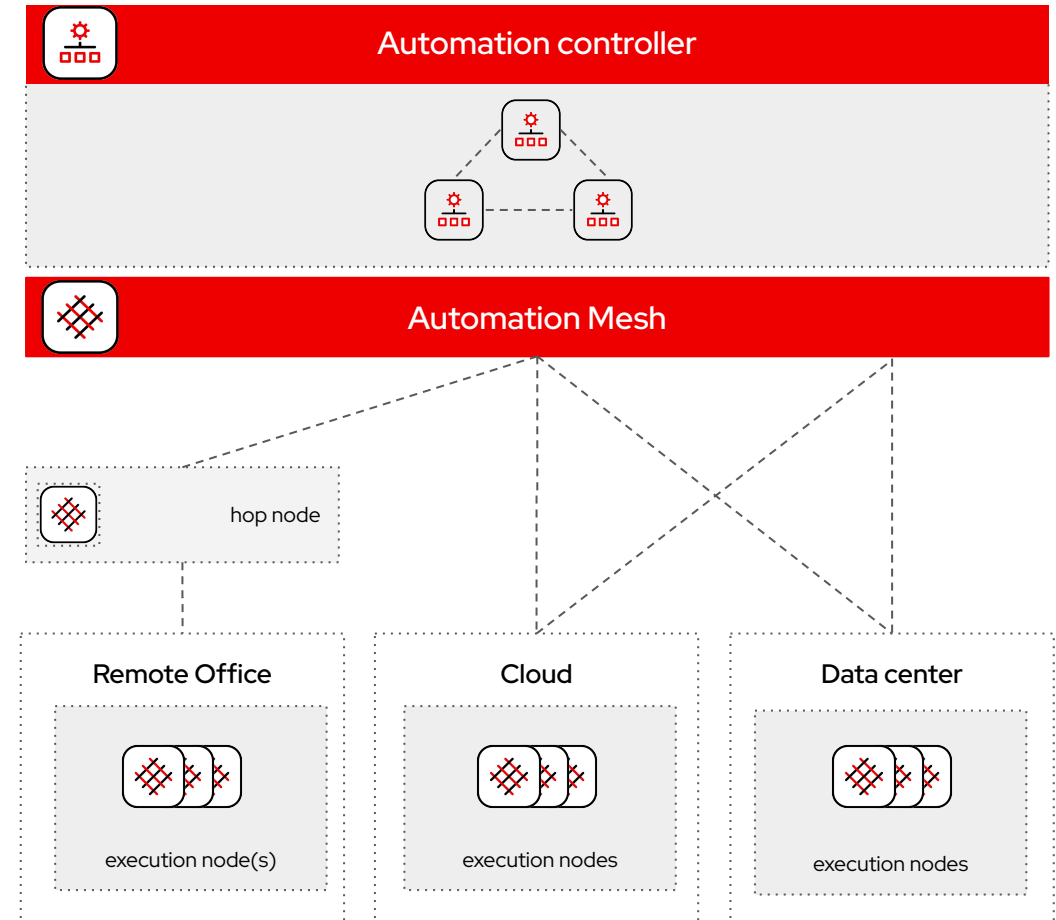

Based on <https://github.com/ansible/receptor>

Flexible architecture

Flexible architecture offers multiple design choices

Execution node health

Health checks performed on execution nodes

Automation mesh node types

Hybrid node

Default for controller nodes

Performs controller runtime functions and automation execution

Controller node

Dedicated to controller runtime functions

Execution capabilities disabled

Execution node

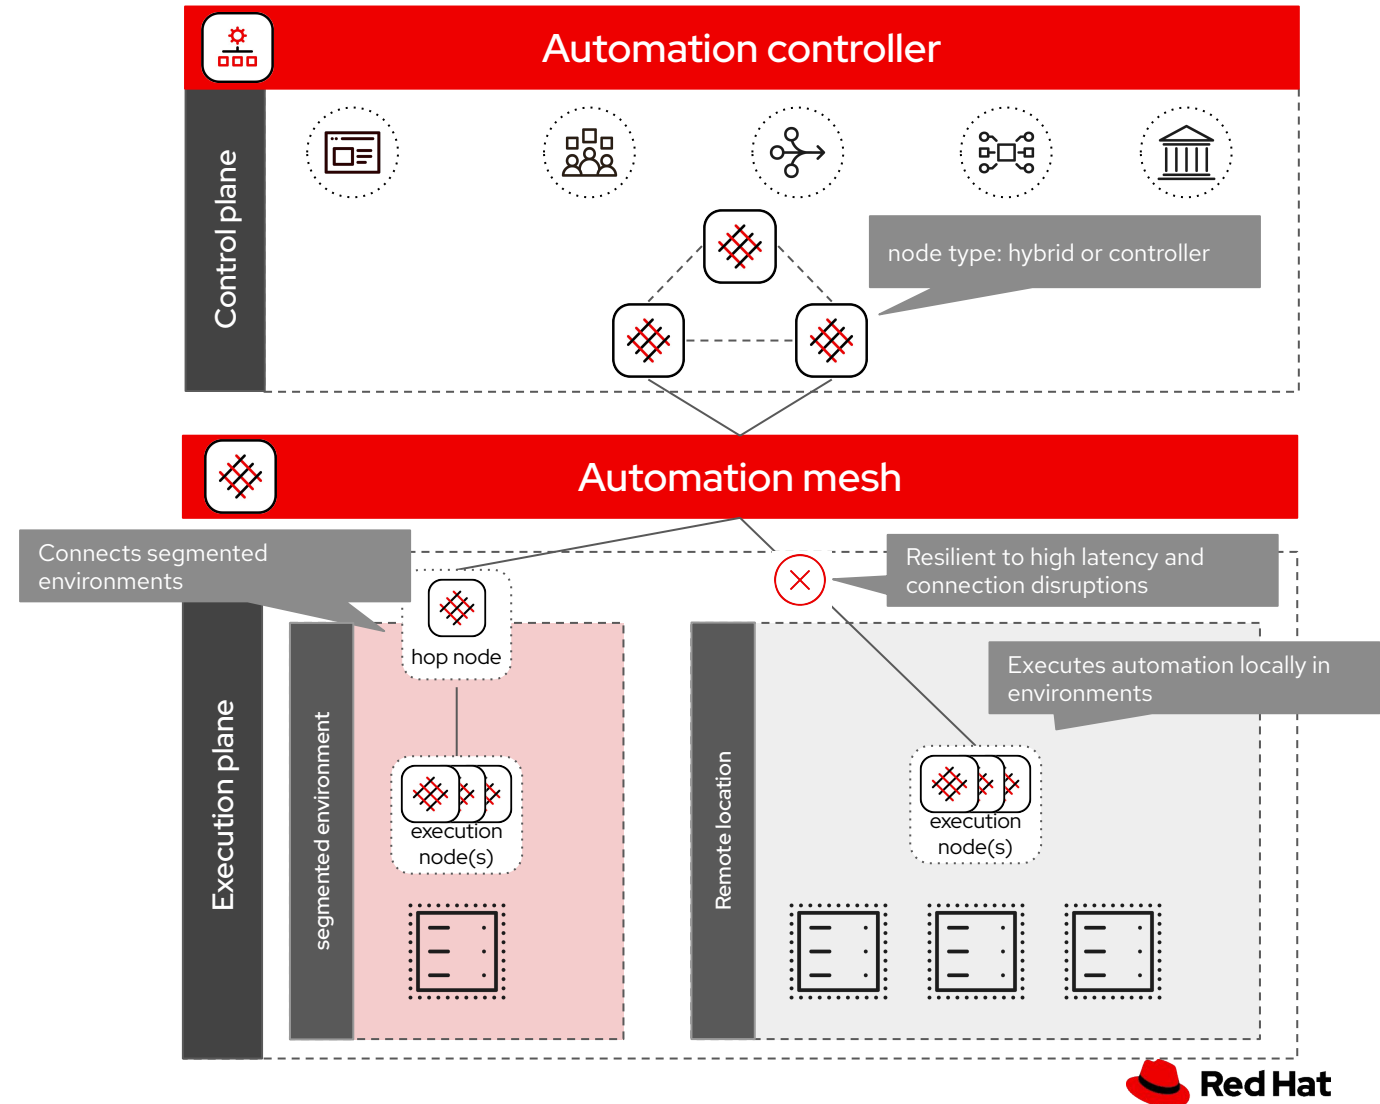

Dedicated to run automation on behalf of controller

Job isolation via podman and execution environments

Hop node

Dedicated to route traffic to other execution nodes

Cannot execute automation

Ansible Automation Mesh in 2.1

Mesh replaces Isolated Nodes

Isolated node where extremely sensitive to latency and connection disruption
Isolated Nodes are discontinued, functionality is provided by automation mesh

Mesh installation

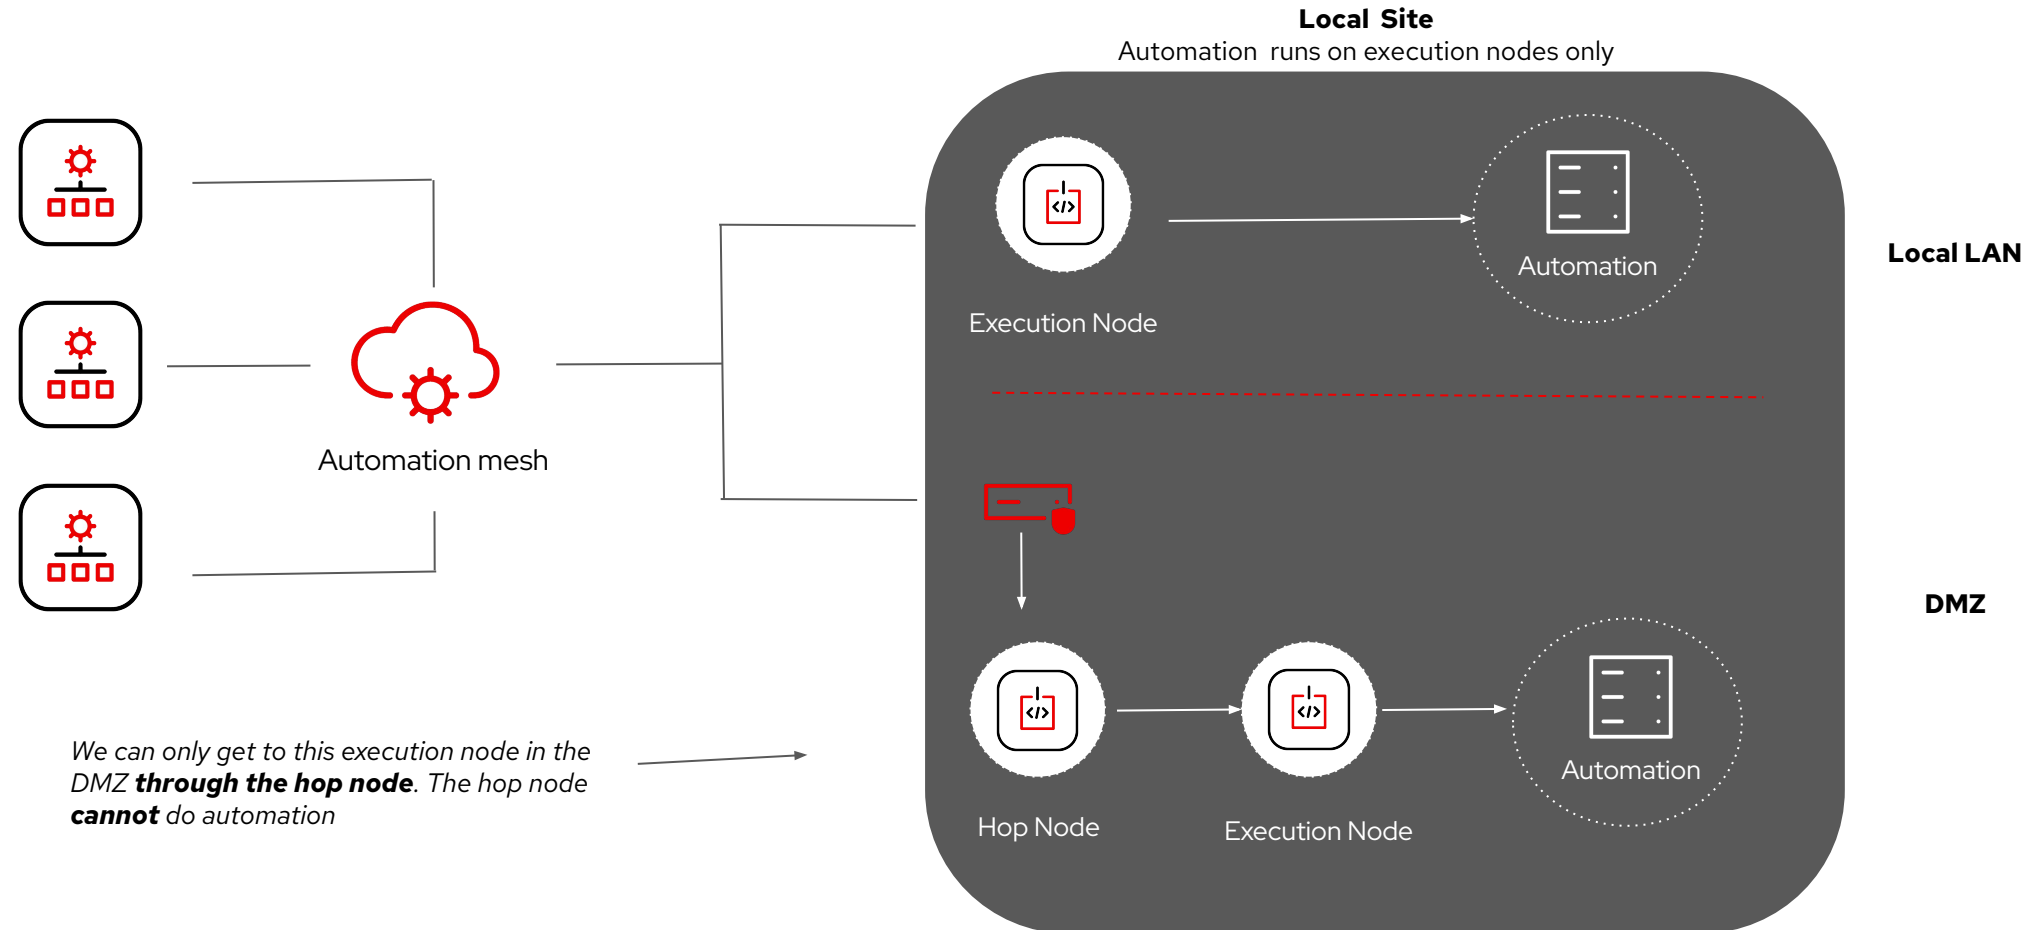

Mesh is installed using inventory installer method
New sections added to inventory file for automation mesh configuration

Graphing

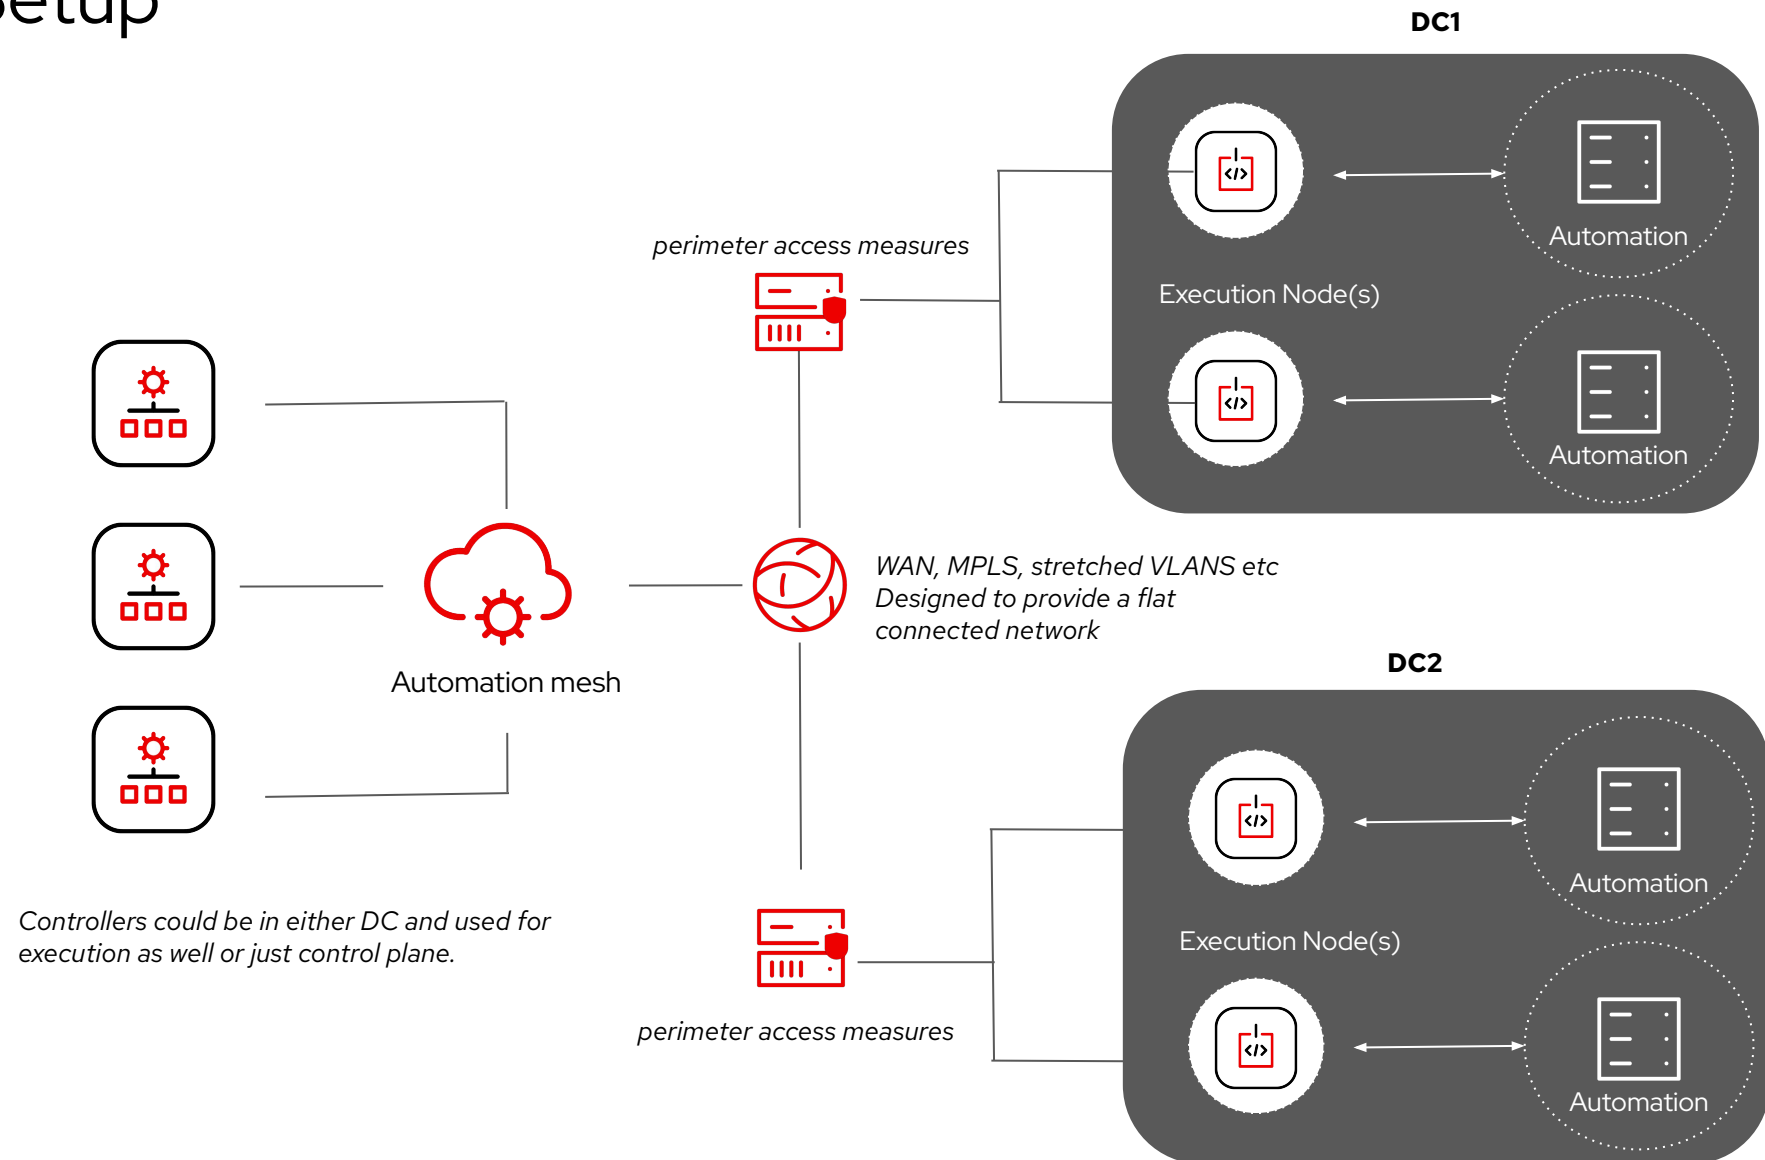

AAP2 installer can be used to create Graphviz dot file

Multi Controller/Multi Execution Nodes and Hop

Multi DC Setup

Automation for Developers and IT Operations

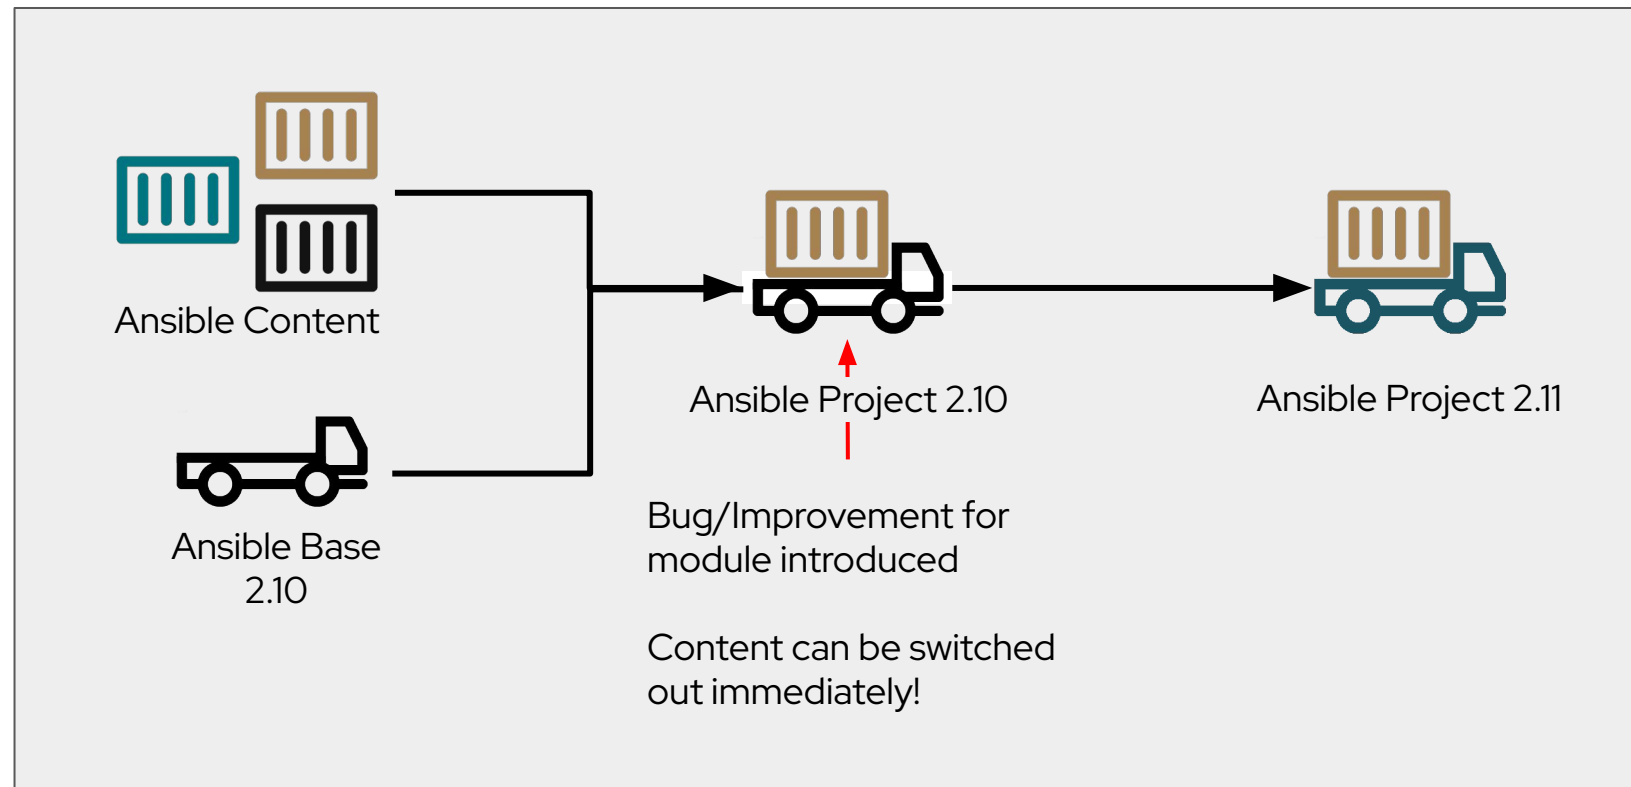

Refresher: Ansible Content Collections

Collections: Simplified and Consistent Content Delivery

What are they?

Collections are a data structures containing automation content:

- ▶ Modules
- ▶ Playbooks
- ▶ Roles
- ▶ Plugins
- ▶ Docs
- ▶ Tests

Automation execution environments

Limitations of Python Virtual Environments

They don't work for the enterprise

Tooling

Python Virtual Environments are not part of the Red Hat Ansible Automation Platform, they are Python constructs meant for Python developers.

Portability

Python Virtual Environments are unique to a single system and hard to replicate on another system.

Maintenance

Python Virtual Environments may have dozens of Python dependencies and become increasingly hard to manage and maintain overtime.

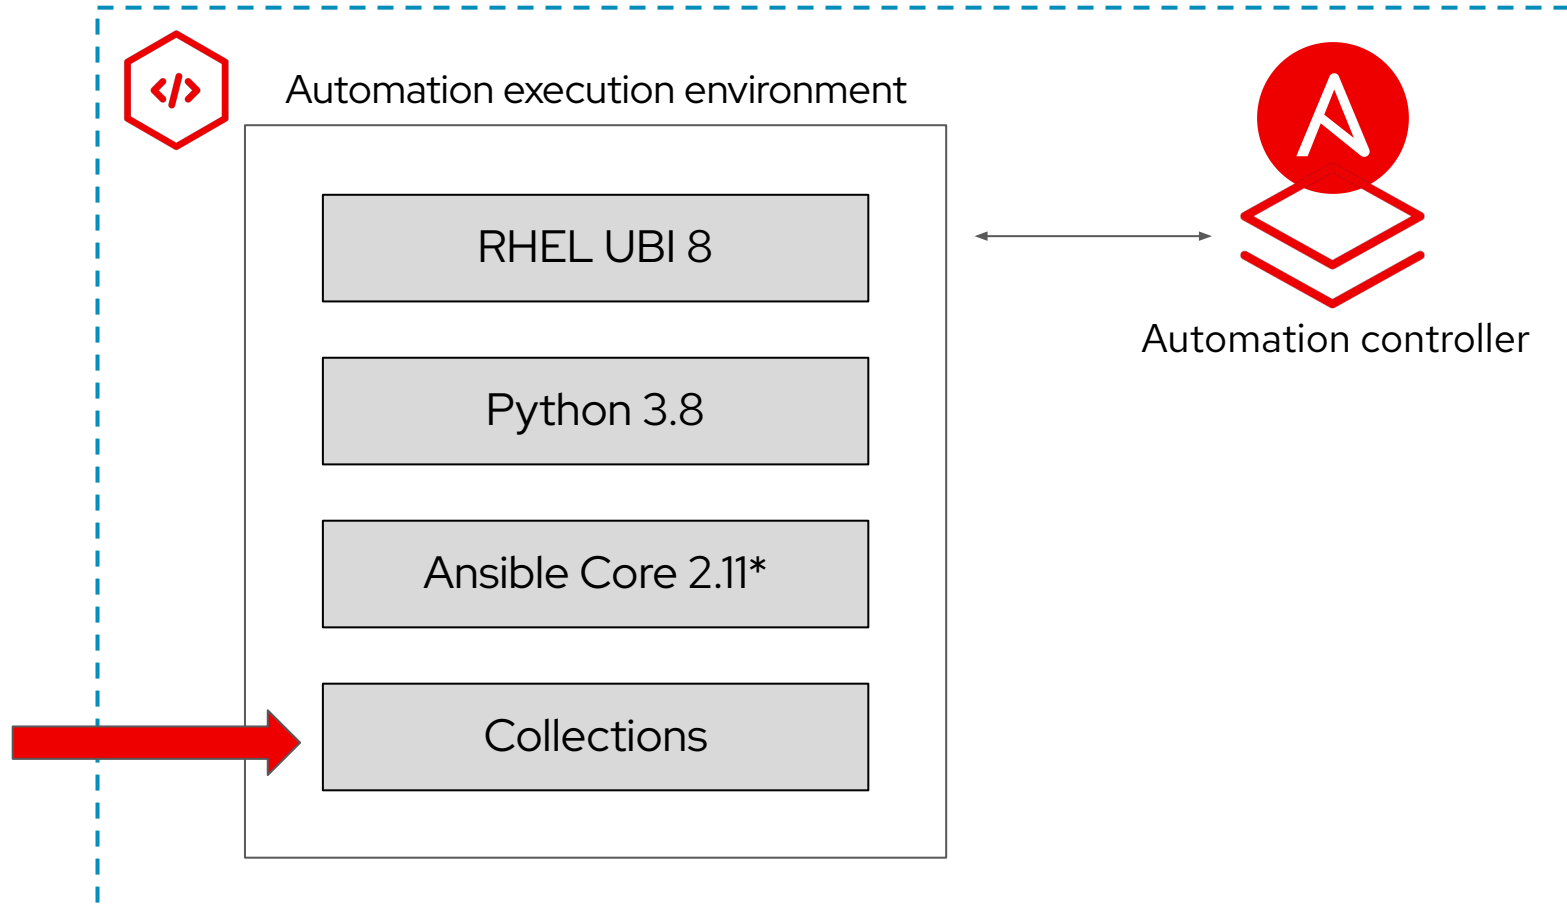

Automation Execution Environments

Components needed for automation, packaged in a cloud-native way

Example Packaging with automation execution environments

-  amazon.aws Collection
-  ansible.utils Collection
-  arista.cvp Collection
-  azure.azcollection Collection
-  ibm.qradar Collection
-  redhat.satellite Collection

*includes other Ansible dependencies/packages

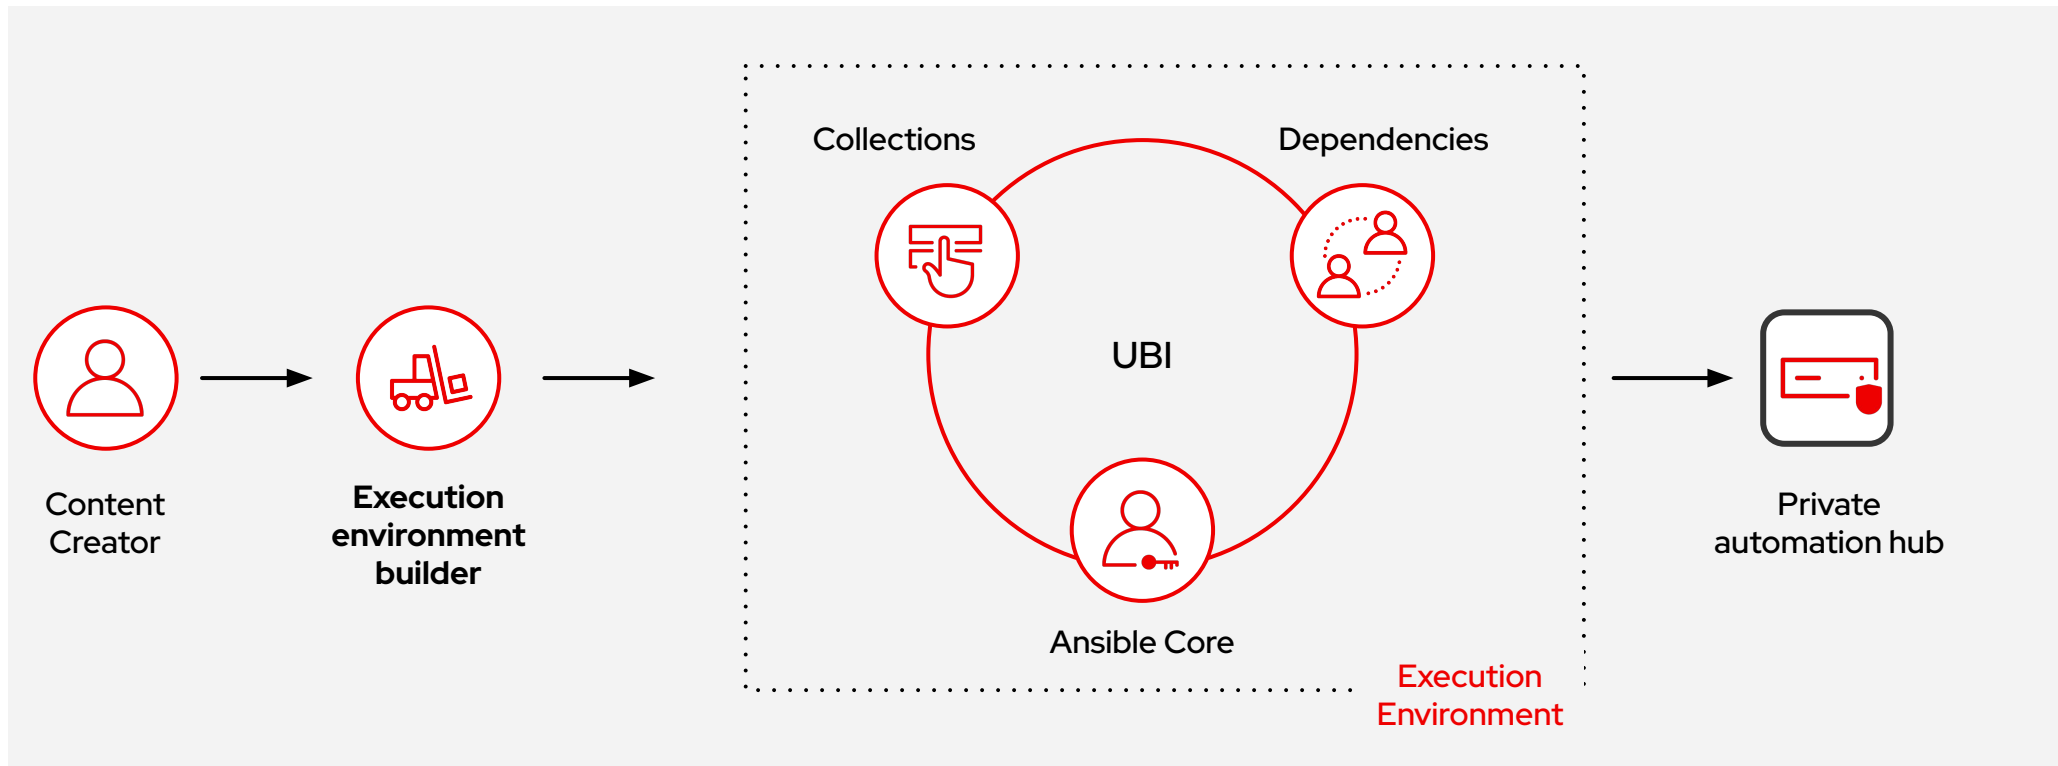

Available automation execution environments with AAP 2

- ▶ **Minimal** (ee-minimal-rhel8) - Contains Ansible Core 2.11 and doesn't contain any Collections.
- ▶ **Supported** (ee-supported-rhel8) - This is the default image. It is built on top of the minimal image and contains content supported by Red Hat.
- ▶ **Compatibility** (ee-29-rhel8) - Contains Ansible 2.9 "batteries included" and is best for customers migrating from Ansible Automation Platform 1.2.

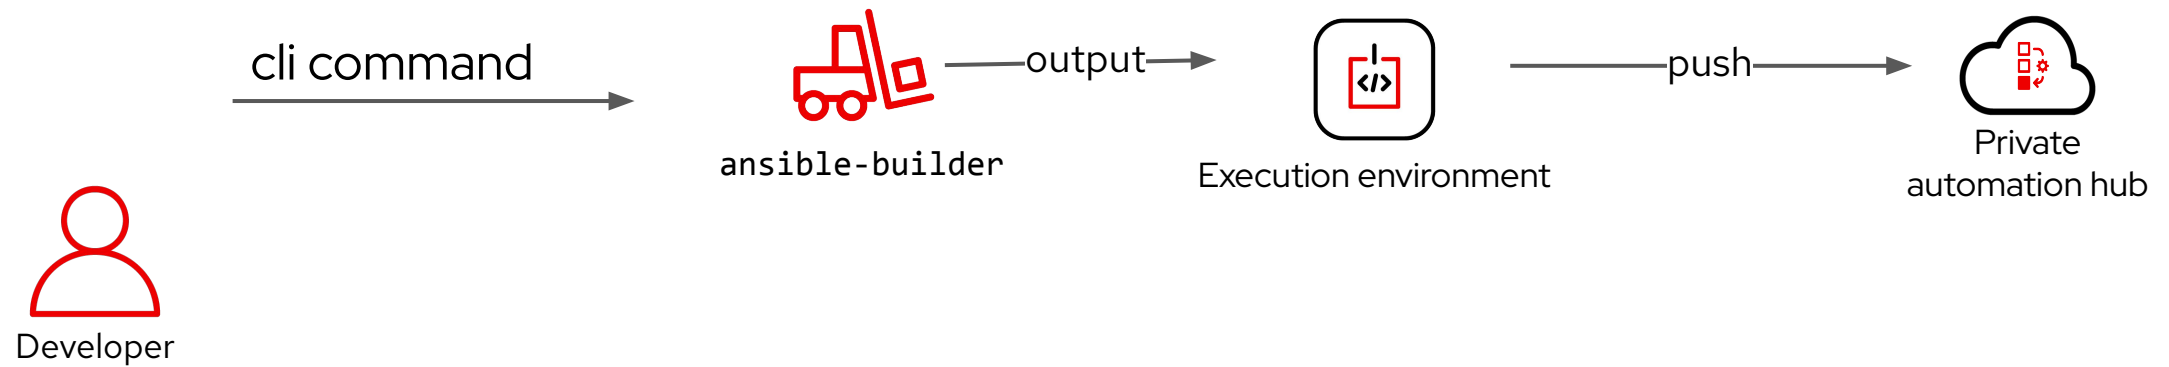

Execution environment builder

Build, create, publish

Development cycle of an automation execution environment

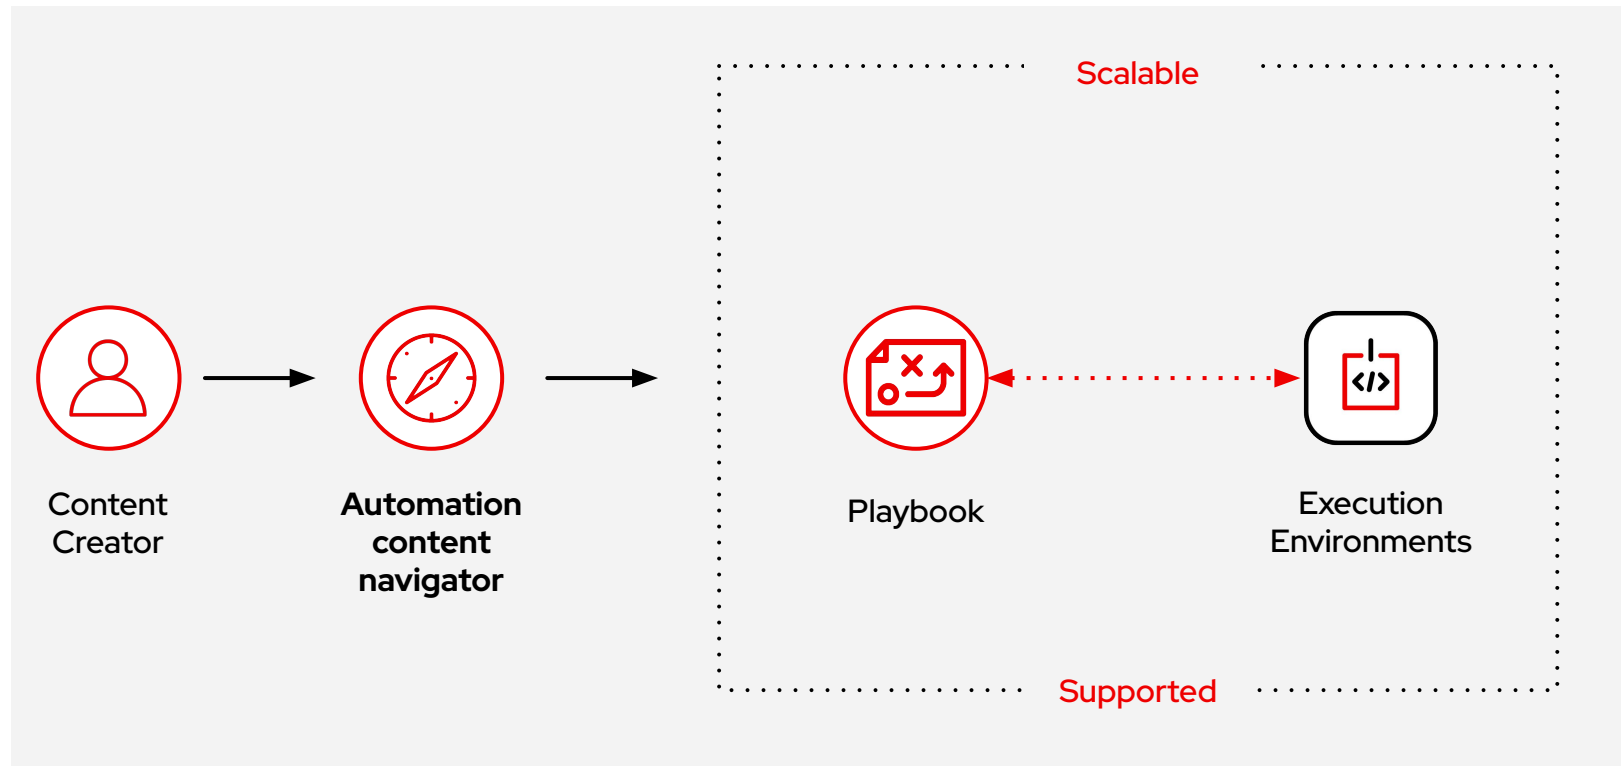

Adapting execution environments

Value of private Automation Hub

The Big Picture

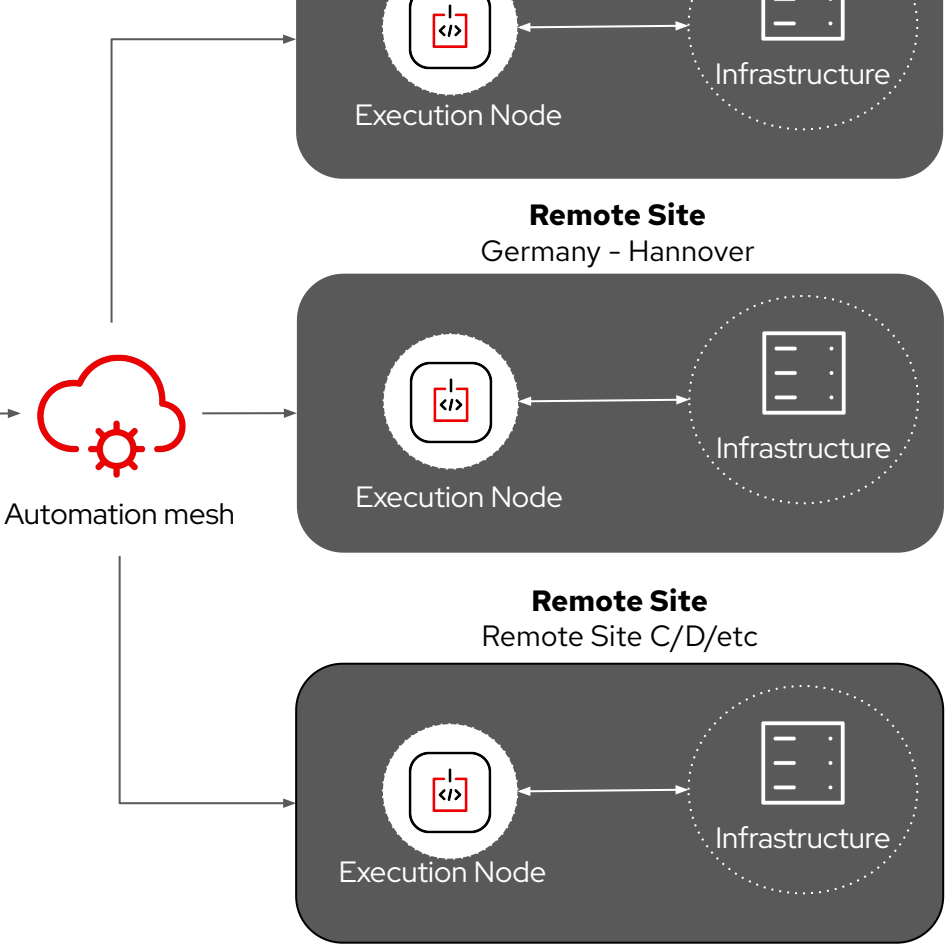

Create

Manage

Scale

Roadmap:

Ansible Automation Platform 2.2 and onwards

Ansible Automation Platform 2.2 – Planned for May 2022

Enhancing the automation user experience

AAP General

- Subscription Consumption reporting
- Collection migration tooling

Automation controller

- Automation Mesh Configuration and Deployment Utility
- Live Topology in WebUI

Automation mesh

- Delivery; sync executions environments over mesh
- Health checks

Automation execution environments

- Lifecycle Definition files

Automation services catalog

- On-premises offering
- OCP Operator

Private automation hub

- Ansible Content Collection signing
- Repo Management

Ansible content tools

- molecule support
- ansible-lint support

Automation content

- Certified Collections with signatures

Automation Controller

Enterprise control plane for automation

Major changes for AAP 2.2

- **Automation Mesh Configuration and Deployment Utility**
WebUI based experience for configuring and deploying Automation mesh
- **Mesh UI visualization**
View existing topologies including hop nodes, execution nodes and controller nodes across multiple sites

Automation Mesh

Execution Environments decoupled from control plane for flexibility

Major changes for AAP 2.2

- **Execution Environment Delivery**
Automatically sync needed Execution Environments
- **Execution Environments for Edge**
Opinionated delivery method for Edge use-cases

Automation services catalog

Self-service access across environments

Major changes for AAP 2.2

- **Self-hosted on-premises version**

In addition to the hosted services on console.redhat.com, Automation services catalog can be standalone and self-hosted

- **Operator for Openshift**

In addition to Automation controller and Private automation hub, Automation services catalog can be installed through Operatorhub

Automation content signing

Major changes for AAP 2.2

Major changes for AAP 2.2

- **Automation Hub**
Certified content from Red Hat and partners is signed on console.redhat.com ensuring end-to-end security
- **Content signing**
Sign private content when you publish to Private automation hub. Both execution environments and Ansible content collections can be signed.
- **Certified Content with signatures**
Certified content from Red Hat will come with accompanying signatures

Q4

November 2022

Ansible Automation Platform 2.3 – November 2022

Extend use-cases and secure enterprise automation end-to-end

Event Driven Automation

Secure Compliant Execution

Differentiated Automation Experience (“Opinionated Content”)

Thank you

Red Hat is the world's leading provider of enterprise open source software solutions. Award-winning support, training, and consulting services make Red Hat a trusted adviser to the Fortune 500.
